Category: Assignment 2 solutions

1. Sensitivity analysis may be carried out at an individual policy level and at a portfolio level. At an individual policy level, sensitivity analysis allows the company to understand the impact of mis-estimating parameter values in the model. It can help show what the reductions would be in profits emerging, return on capital or other metrics targeted. This may help assess what margins may be included in the parameter values for the risk that are not borne out in reality. At a portfolio level, sensitivity analysis can be used to assess the impact of shifts in mix of business. Some parts of the portfolio may be more profitable than others and this analysis will highlight the possible impact on overall profitability of the product. Sensitivity analysis on the volume of business can also be used to assess the overall profits emerging. This may be useful to validate the viability of any development expenditure associated that may be associated with the pricing exercise. This can also help the company to understand the possible risk to its capital position if volumes are more than expected.

-777

-133

iv)

Answer: a)

To calculate the expected provisions at the end of each year we have (utilising the end of year cashflow figures and decrement tables in (i) above):

2V=133/1.04=127.88

end of year cashflow

Cashflow is year 2 = -777-(ap) $_{41}$ *₂V

=>Cashflow is year 2 = -777-(ap)41**127.88 = -898.37

=> 1V = 898.37/1.04

=> 1V = 863.82

These need to be adjusted as the question asks for the values in respect of the beginning of the year. Thus we have:

Year 2 127.88(ap)41 = 121.37

Year 1 863.82(ap)40 = 776.83

IACS

v)

Answer: a)

Based on the expected provisions calculated in (a) above, the cash flow for years 2 and will be zeroised whilst year 1 will become:

2226 -776.83 = 1,449.17

Hence the table blow can now be completed for the revised profit margin revised end of year cash flow:

| | 1,449.17 | 0 | 0 | 583 |
|----------------------|----------|----------|----------|----------|
| probability in force | 1 | 0.899291 | 0.853504 | 0.809934 |
| discount factor | 0.925925 | 0.85733 | 0.793832 | 0.735029 |
| | | | | |

expected p.v. of profit: 1688.90

3.

i) The vector of balancing items in the projected revenue accounts for each policy year is called the profit vector. Profit vector gives the expected profit at the end of each policy year per policy in force at the beginning of that policy year.

(1) **\RIAL**

The objective specified for expected level of profit is termed as "profit criterion".
 E.g. NPV = 40% of Initial Sales Commission

(2) | D | F S

III) Diele disease tente e riele francesta e manaia fea riele

Profit Margin = 3% of the EPV of Premium Income

EPV profit
$$_{(@13\%)}$$
 = -250v + 150v² + 200v³ + 225v⁴ , where v = $^{1}/_{1.13}$ = 172.84

Let the first year premium be P.

EPV premiums
$$_{(@13\%, \text{ AM92 Ultimate})} = P (1 + 1.04_1p_{42}v + 1.04_2^2p_{42}v^2 + 1.04_3^3p_{42}v^3)$$

= P (1 + 0.919338 + 0.845094 + 0.776754)
= 3.541186 P

Profit margin = (EPV profit / EPV premiums)

$$5\% = \frac{172.84}{3.541186 P}$$

$$P = 976.17$$

The company must charge a premium of Rs 976.17 in the first year of the contract.

i) Experience basis is used to calculate the expected future profits of a contract for comparison with a stated profit criterion. It represents the best estimate of expected future experience.

Pricing basis is used while setting premium. Assuming that the risk discount rate reflects fully the uncertainties in the assumptions, the pricing basis represents the insurer's realistic expected outlook.

Valuation (or reserving) basis is used to calculate the reserves to be held by an Insurer. It represents prudent assumptions (pessimistic as compared to best estimate) of expected future experience.

(3)

- ii) While the student actuary is correct that reserves are held such that there is an acceptably low probability of insolvency occurring in the future, it is incorrect to assume that everyone will die on the day after the valuation date. This is because:
 - A company whose reserving basis is extremely pessimistic will be holding extremely high reserves leading to large capital requirement. This will require higher profits resulting in higher premiums/charges for customer.
 - The reserving basis chosen has to satisfy any local legislation and professional guidance which exists to protect the interests of the policyholders.

iii) We need the profit vector of the policy in order to calculate the non unit reserves. It can be derived by dividing the given profit signature with the probability of surviving to the start of that year.

$$= \left(-20, -35.20 \right/_{1} p_{[70]}, 50 \right/_{2} p_{[70]}, -28.50 \right/_{3} p_{[70]}, -20 \right/_{4} p_{[70]}, 90.21 \right/_{5} p_{[70]}$$

$$= (-20, -35.79, 52.12, -30.65, -22.27, 104.40)$$

Let reserves required at the end of policy year n be denoted as ${}_{n}V$.

No reserve will be required at the end of the fifth year. $_5V = 0$.

$$_{4}V = \frac{^{22.27}}{^{1.06}} = 21.01$$

After setting up 4V, the revised profit in year five will be 0.

$$_{3}V = \frac{(30.65 + 21.01 \,_{1}p_{73})}{1.06} = 48.06$$

After setting up 3V, the revised profit in year four will be 0.

The cashflow of year 3 is sufficient to set up this reserve. Hence $_2V = 0$.

Allowing for this, the revised profit in year three will be

$$= 52.12 - 48.06_{1}p_{72}$$

$$= 5.54$$

$$_{1}V = \frac{35.79}{1.06} = 33.76$$

After setting up 1V, the revised profit in year two will be 0.

The revised profit in year one will be

$$= -20 - 33.76 \, _{1}p_{[70]}$$

$$= -53.20$$

The revised profit vector is

$$(-53.20, 0, 5.54, 0, 0, 104.40)$$

5.

E OF ACTUARIAL ITATIVE STUDIES

i)

Unit fund represents the value of unit of the policyholder at any time.

It does not necessarily represent the amount that the policyholder is entitled to at any point. For example, on surrender, policyholder will get the surrender value which is the proportion of unit fund.

On death, maturity or surrender, the units held will be used to pay the benefit.

Non-unit fund will arise from the following sources:

- a. premium less cost of allocation i.e. the difference between the premium paid and the amount invested in the unit fund
- b. expenses incurred by the insurer
- c. interest earned on non-unit fund
- d. FMC taken from unit fund
- e. Cost of outgoes if outgo amount is greater than the value of units
- f. Profit on surrender

JARIAL

& QUANTITATIVE STUDIES

ii)

The life company sets up non unit reserves if the overall cash flow in any month other than month one is negative without reserves. The policy should be self-financing after month one.

Reserves are set up early so that money can be released as and when required to eliminate the negative cash flow. Setting up reserves will result in delay of profits but gives the comfort to the company that capital is sufficient to support the policy throughout the term.

(i)

| Year | Age | Profit vector | qx | Px | p(x-1) | Profit signature | Present value |
|------|-----|---------------|----------|----------|----------|------------------|---------------|
| 1 | 30 | -250 | 0.00059 | 0.99941 | 1 | (250.00) | (235.85) |
| 2 | 31 | -400 | 0.000602 | 0.999398 | 0.99941 | (399.76) | (355.79) |
| 3 | 32 | -600 | 0.000617 | 0.999383 | 0.998808 | (599.29) | (503.17) |
| 4 | 33 | 1500 | 0.000636 | 0.999364 | 0.998192 | 1,497.29 | 1,185.99 |

(ii)
$$2V = 600 / 1.03 = 582.52$$

$$1V = (400 + 582.52 * 0.99941) / 1.03 = 953.57$$

Year 1 revised cashflow = -250 - 953.57 * 0.99941 = -1203

(iii) The NPV after zerosising negative cashflows to achieve a single financing phase is smaller. This is because the negative cashflows have been accelerated hence being discounted less. [1]

- ii) Reserves do not reduce profits; they only defer the release of profits.
 - So, if the interest earned on reserves is equal to the risk discount rate than the there is no effect of deferring the profit as the opportunity cost on money held as reserves is zero.

Therefore, the profit margin will be same as calculated earlier.

[3]

iii) Since the mortality rates and surrender rate is the same in the valuation basis and pricing basis, we will be able to use the dependent probabilities derived in i).

To calculate the expected provisions at the end of each year we have:

$$_{1}V \times 1.07 - (ap)_{43} \times _{2}V = -(-760.10)$$

$$\rightarrow$$
 ₁V = 4269.06

These need to be adjusted as the question asks for the values in respect of the beginning of the year. Thus we have:

Year 2
$$4235.75 \times (ap)_{43} = 3807.79$$

Year 1
$$4269.06 \times (ap)_{42} = 3838.61$$

i) The unit fund will be projected as under:

| Policy year | Premium allocated | Cost of allocation | Plus fund b/fd | Fund before charge | Fund management charge | Policy admin. Fees | Fund c/fd |
|----------------|----------------------|--------------------|-------------------|--------------------------|------------------------------|--------------------------|-----------|
| 1 | 17500.00 | 15750.00 | 15750.00 | 16852.50 | 84.26 | 500.00 | 16268.24 |
| 2 | 27500.00 | 24750.00 | 41018.24 | 43889.52 | 219.45 | 500.00 | 43170.07 |
| 3 | 27500.00 | 24750.00 | 67920.07 | 72674.47 | 363.37 | 500.00 | 71811.10 |
| 4 | 27500.00 | 24750.00 | 96561.10 | 103320.38 | 516.60 | 500.00 | 102303.78 |

The expected profit will be calculated by projecting the non unit cashflows as under:

| Policy year | Profit on allocation | Expenses | Non unit interest | Fund management charge | Policy admin. fees | Non unit death cost | Profit in each year |
|----------------|----------------------|----------|-------------------------|------------------------------|--------------------------|------------------------------|---------------------|
| 1 | 9250.00 | 3500.00 | 402.50 | 84.26 | 500.00 | 730.98 | 6005.78 |
| 2 | 250.00 | 1100.00 | -59.50 | 219.45 | 500.00 | 327.45 | -517.50 |
| 3 | 250.00 | 1100.00 | -59.50 | 363.37 | 500.00 | 0.00 | -46.13 |
| 4 | 250.00 | 1100.00 | -59.50 | 516.60 | 500.00 | 0.00 | 107.10 |

IAL

ii)The non-unit reserves required are:

Start of year 3: 46.13/1.07 = 43.11

End of year 2: $43.11 \times 0.985 + 517.50 = 559.96$

Start of year 2: 559.96/1.07 = 523.33End of year 1: $523.33 \times 0.985 = 515.48$

The calculations of revised profit are as under:

| Policy year | Non unit reserve b/fd | Interest on reserves | Increase in reserves | Profit ignoring reserves | Profit allowing for reserves |
|-------------|--------------------------|----------------------|----------------------|--------------------------------|------------------------------------|
| 1 | 0.00 | 0.00 | 515.48 | 6005.78 | 5490.30 |
| 2 | 523.33 | 36.63 | -480.87 | -517.50 | 0.00 |
| 3 | 43.11 | 3.02 | -43.11 | -46.13 | 0.00 |
| 4 | 0.00 | 0.00 | 0.00 | 107.10 | 107.10 |
