

Macro Economics – Assignment 1

Name: Ishika Shah

Roll No.: 422

1. C. If the Government raises output above the free market level, consumers will get no benefit from the extra units of output
2. C. The gap between $S+tax$ and S will be Rs. 5 at each quantity
3. C. Marginal revenue = marginal cost
4. C. Is rival and excludable
5. C. Reduced barriers to the international factor movements
6. C. Rise and Real GDP will rise
7. C. No alteration to tariffs without negotiation with their trading partners
8. C. To impose trade sanctions on countries with which it disagrees politically
9. D. Petrol consumption involves external social costs
10. D. Nominal GDP uses current prices; real GDP uses constant prices
11. C. The periodic fluctuations of output around the long run trend
12. C. Net income from abroad
13. C. This could lead to 'Black' market where the cylinders are sold at more than the ceiling price
14. C. Rs. 120 Cr
15. D. Rs. 800 Cr
16. C. Efficient management in the production to increase profits
17. D. Zero net social benefit
18. B. Only negative externalities exist
19. B. $Y = C + I + G$
20. B. Government expenditures
21. B. 606 Billion
22. C. 542 Billion
23. D. 621 Billion

24. C. 556 Billion
25. D. Large populations
26. B. GDP at constant prices for 2021 is estimated with the base year as 2010-11
27. B. Country Y has a comparative advantage in the production of mobiles
28. D. 280 Million
29. NDY = 60300
 GDY = 62000
 NNY = 60000
- 30.

Q^*

Q_{Pc}

1. MSC- Marginal Social cost
2. MPC- Marginal Private Cost
3. MPB- Marginal Private Benefit
4. MSB- Marginal Social Benefit
5. MECc- Marginal External Cost of consumption
6. Q^* - Socially optimum level of output at price P^*
7. Q_{Pc} - Market level of output at price P_{pc} .

8. Deadweight loss of social welfare happens when $MSC > MPC$

9. Social welfare loss occurs as $Q_{Pc} > Q^*$

As plastic is causing environmental pollution, it has a social cost. Individuals are using plastic as it is convenient for them. Therefore, Marginal Social Cost (MSC) differs from Marginal Personal Cost (MPC). 2. Plastic usage causes environmental pollution and animals may die due to the consumption of plastic bags. Therefore, there is a Marginal external Cost that may be incurred to keep water bodies clean and to protect animals from consumption of plastic. 3. Therefore, MSB is lower than MPB. $MSB = MPB - MEC_c$. This is represented by the MSB curve below the MPB curve in the diagram. The market will have an equilibrium position at Q_{Pc} with Price P_{pc} . At socially optimal equilibrium at output Q^* of price P^* , $MSB = MSC$. 4. The external cost of consumption results in the level of output above socially optimum level, $Q_{Pc} > Q^*$. From society's point of view, too many plastic bags are being produced and consumed. This results in a deadweight welfare loss caused by overconsumption and is represented by a triangle in diagram A.

31. A

32. Negative Externality Definition - Negative externalities occur when production and/or consumption impose external costs on third parties outside of the market for which no appropriate compensation is paid. This causes social costs to exceed private costs. An example of a negative externality: i. People may smoke in public places and ignore the harmful impact of toxic passive smoking on non-smokers. ii. Passive smoking may harm the health of non-smokers and may cause various respiratory diseases. iii. In young ladies, passive smoking may cause pre-mature childbirth and asthma. iv. Passive smoking increases the risk of respiratory illnesses in children, including asthma, bronchitis, and pneumonia. v. Healthcare expenditure involved in the treatment of smoking-related illnesses

ii) Price Related Intervention: a) The Government imposes a tax on the producer that reflects the marginal cost of the externality. b) Fines are imposed if smoking is done in public places

Non- Price Related Intervention: a) Smoking is banned in public places like gardens, restaurants, libraries, workplaces, etc. b) A law prohibiting any manufacturer, retailer, or distributor of tobacco from selling or distributing products to persons under age eighteen. c) Use of media/advertisements, public education to emphasize ill effects of smoking and motivate smokers to leave smoking d) Specially designed medical care and or programs for smokers to quit smoking. iii) Diagram- marginal social benefit curve and marginal private benefit curve when a negative externality in consumption exists

Q1- Consumption by private sector

Q2- Socially optimal level of consumption

MSB- Marginal Social Benefit

MB- Marginal Private Benefit

P1- Market price

33. Actual economic growth can also be known as demand side economic growth because it is affected by changes in the demand in an economy. It is an increase in output as measured by real GDP/ national income. It can be achieved by shifting AD (Aggregate demand) to the right by increasing AD, by influencing any of the factors of aggregate demand. (As shown below) •Consumption •Government Spending •Net Exports * Investment (However this is also a component of LRAS) On the other hand potential deals with the supply side of the economy. It is an increase in the productive capacity (potential). An increase in the short term/long term aggregate supply will cause potential economic growth. The short term deals with costs of production and the long term is affected by changes in the quality and quantity of the factors of production.

34. Income measure : This measures the total of factor earnings. These are factor payments to land, labour and capital. Transfer payments are not included (to avoid double counting).

Output measure: This measure the value of goods and services produced. To avoid double counting we only include the "value added" component of firms' output.

Expenditure method: This includes all expenditure (including exports minus imports) in the economy and also what would have to be spent to purchase increases in inventories (or stocks). To avoid double counting, we include only expenditure on final goods.

The three concepts are identically equal. However, in practice difficulties of measurement and collection of data (eg the black economy) mean that the three measures will not be equal.
